Bedford, NH 03110-0755 U.S.A.

Cranium is a physical property estimation software package capable of predicting properties for organic compounds, polymers, and electrolytes. Properties are estimated for both pure components and mixtures (up to 100 components). Users simply draw their compound's molecular structure or enter its composition and Cranium automatically analyzes the structure for important functional groups, selects the best estimation technique, retrieves any required property data, and generates the most accurate estimate possible.
